SUMMARY

Full-stack engineer with a backend focus and over two years of experience building and improving production software. I've worked on payment flows, inventory systems, healthcare services, and financial recordkeeping, where correctness and reliability matter to the people using them. I enjoy digging into problems beyond the obvious fix, understanding why they happen, and building solutions that hold up in practice. I bring hands-on experience, curiosity, and a willingness to learn quickly while contributing to a team.

EXPERIENCE

Sync360, *Backend Engineer* 06/2026 – Present
Remote

- Rebuilt inventory management around batch-level tracking, ensuring stock valuation, cost of goods sold, and profit calculations reflected actual purchase costs across different batches. Reduced inventory-related complaints from 3+ per week to zero after release.
- Built a multi-tier customer loyalty system that lets businesses reward repeat purchases and improve customer retention.
- Integrated Akawopay's Buy Now, Pay Later (BNPL) service into checkout, implementing webhook processing, transactional state management, and retry handling to support reliable payment flows while enabling businesses to receive payment upfront on credit-approved sales.
- Improved storefront response times by diagnosing slow database queries, adding indexes, and implementing cache invalidation to keep product data consistent with database updates.
- Built automated asynchronous ETL reporting pipelines using Celery and openpyxl, pulling sales, expense, and inventory data into scheduled monthly Excel reports and eliminating 3+ hours of manual bookkeeping weekly.

Toltimedcare, *Backend Engineer* 09/2024 – 02/2026
Ibadan, Nigeria

- Built backend services for a healthcare booking platform that matches patients with verified nurses and community health workers, using a modular API architecture that separates business logic, data access and external integrations.
- Implemented geolocation-based matching so patients are paired with workers within good proximity.
- Engineered the platform’s payment system, integrating Velvpay for wallet operations with response validation and failure handling, and QoreID for identity verification.
- Containerised services with Docker and moved background work to Celery and Redis, separating request handling from asynchronous workloads.

TrybeNode, *Full Stack Developer* 02/2024 – 07/2025
Ibadan, Nigeria

- Contributed to the development of TrybeMarket, a campus-focused e-commerce platform, implementing core shopping features and integrating frontend components with backend APIs and database operations.
- Developed and maintained application workflows involving product catalogues, user authentication, and order processing, focusing on reliable data handling, API integration, and maintainable application architecture.

EDUCATION

Bachelor's Degree in Software Engineering, *Lead City University* 09/2022 – 07/2026
Graduated First Class - 4.88/5.0 CGPA Ibadan, Nigeria

SKILLS

Languages: Python, TypeScript, JavaScript | **Backend frameworks:** Django REST Framework, FastAPI, NestJS | **Frontend:** React, Next.js | **Data:** PostgreSQL, pgvector, MongoDB, Redis | **Infrastructure:** Docker, AWS

PROJECTS

Kontributa , *Group-contribution payments platform*

- Designed and built the platform end to end, with a dual-provider payments abstraction (Monnify and Paystack) and settlement through provider sub-accounts.
- Implemented a configurable platform fee locked at invoice generation, and an append-only, hash-chained audit log with database-level write revocation to make financial records tamper-evident.
- Built Redis-backed JWT authentication with token rotation and reuse detection, and real-time payment confirmation via Ably.

AI-Driven Semantic Search with Explainable Ranking, *Undergraduate thesis*

- Built a semantic search system using Sentence-BERT embeddings and pgvector, with RankSHAP to explain ranking decisions.
- Evaluated retrieval quality using NDCG, MAP and MRR.
